

After Market Business @ Kössler

After Market Business @ Kössler

Renewable energy from water power produces clean electricity. Hydro Power Plants are moreover long term investments. AMB@Kössler assures save operation for decades with high availability!

Before a small hydro power plant finally enters service, years will have passed during which licenses have to be applied for, the power station concept is being planned and the electro-mechanical equipment is delivered. As the investors have to make substantial advance payments during this period, it is all the more important to ensure power generation during the operation of the plant and to keep its availability at a maximum level.

Kössler is renowned as a reliable and competent partner for new equipment for small hydro power plants. But for us, our service does not end with the handover of the plant to the customer. Instead we accompany you during the complete life

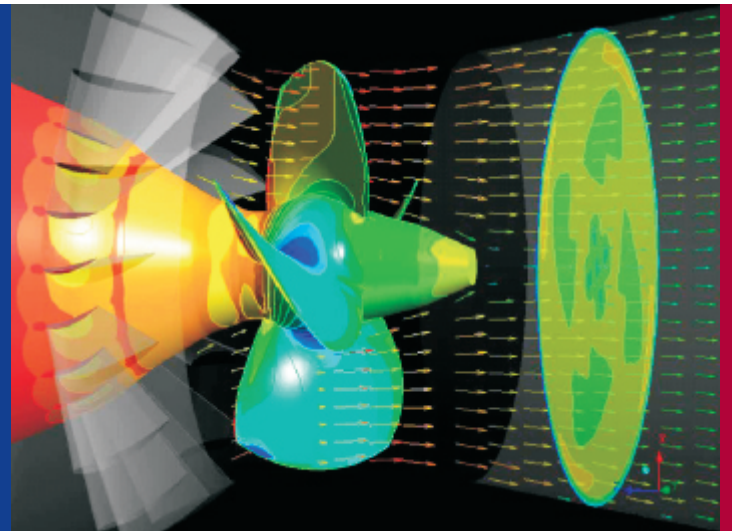

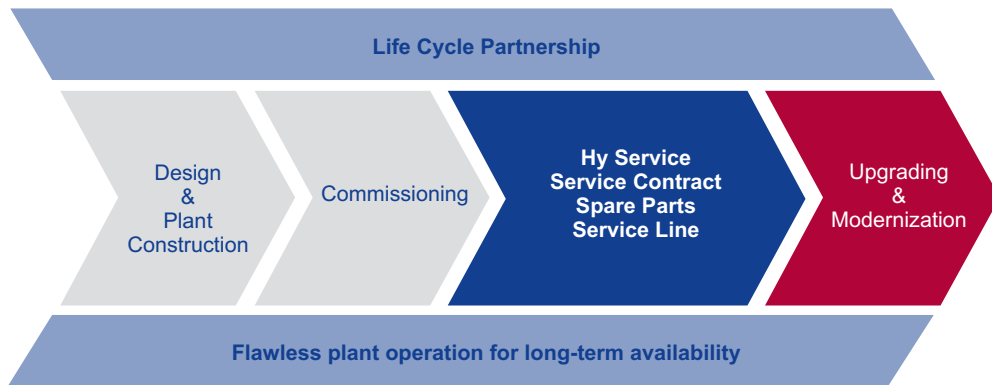

cycle of your power station with our AMB specialists.

AMB stands for After Market Business and covers service during actual operation – so-called „High service“ – annual maintenance, original spare parts and fast and competent help in the event of a failure.

777

Is therefore the number of our service line, which is open for you on 7 days a week, from 7 hours in the morning to 7 hours in the evening for possible power station failures. It is manned by mechanical and electrical technicians who provide expert telephone support to eliminate your problem or ensure prompt service calls during weekdays.

After Market Business @ Kössler

New turbine controller systems made by Kössler allow a remote diagnosis of your power station; if you have an older-generation plant, we recommend retrofitting a remote access maintenance module. Should it really not be possible to eliminate the fault by remote access, our service technicians will promptly be at hand and attend your plant personally.

Depending on their operation patterns and operating conditions, power stations have a life cycle spanning many decades. Here, too, Kössler offers tailor-made service for general overhauls, for example by installing self-lubricating bearings, restoring original

hydraulic contours or providing special coatings to prolong your plant's service life, up to carrying out performance and operating analyses to increase efficiency. As a result of our affinity with the technological leader Voith Hydro, we always have the latest developments – also for small hydro power stations – at our disposal.

AMB @ Kössler offers comprehensive solutions, from maintenance during actual operation to trouble-shooting service and complete upgrades, and thus ensures the economic viability of your small hydro power plant.
